Propuesta

El propósito de esta dapp es el de crear un programa que permita la compra de "vuelos" o boletos en una aerolínea, que, al mismo tiempo, permita regresarlos/cancelarlos. Cada que se realiza la venta de un vuelto se genera un token, que cuando cancelan u ocupan se regresa.

Interfaz

Métodos

Consulta de boletos: Consultar la cantidad boletos disponibles.

```
async Balance(): Promise<void> {
   const addressDapp = this.cantboleto.get('dircant')?.value;
   console.log(addressDapp);
   const accountBalance = await this.getBalanceByAccount(addressDapp);
```

```
console.log(`accountBalance => ${accountBalance}`);
  this.balanceOf = accountBalance;
}
```

Diseño:

Transferencia de boleto: se le asigna un token al movimiento o compra del vuelo.

```
async transferir(): Promise<void> {
    const address1 = this.transboleto.get('recep')?.value;
    const numsgc = this.transboleto.get('nump')?.value;
   this.web3s.contrato.methods.transfer(address1, numsgc).send({from:
this.web3s.accounts[0]})
    .then((response:any) => {
     this.resultado = "Transacción exitosa";
     this.blockHash = response.blockHash;
     this.blockNumber = response.blockNumber;
     this.from = response.from;
     this.transactionHash = response.transactionHash;
     this.web3s.contrato.methods.approve(address1, numsgc).send({from:
this.web3s.accounts[0]})
  })
   .catch((error: any) => {
     console.log(error);
     this.resultado = "Error";
```

Diseño:

Regresar boleto: tiene dos funciones, el de regresar el token a la dirección de origen cuando se ocupe el boleto o cuando haya una cancelación.

```
async regresar(): Promise<void> {
    const cuent1 = '0x9Da3c0B8cF4774Bda306D3Ee54dfBEF59ba5d8D8';
    const cantboletos = this.regresarboleto.get('cantboletos')?.value;
    this.web3s.contrato.methods.transfer(cuent1, cantboletos).send({from:
this.web3s.accounts[0]})
    .then((response:any) => {
      this.regresarr = "Voleto regresado con éxito";
     this.blockHash = response.blockHash;
      this.blockNumber = response.blockNumber;
     this.from = response.from;
     this.transactionHash = response.transactionHash;
     this.web3s.contrato.methods.approve(cuent1, cantboletos).send({from:
this.web3s.accounts[0]})
  })
   .catch((error: any) => {
     console.log(error);
      this.regresarr = "Error no se pudo regresar el boleto :(";
   });
```

Diseño:

```
<div class="card">
```
